

POKEDEX API by Daniel Avzaradel

OVERVIEW:

A simple Pokedex web app, responsive, using api fetch using React framework to display cards of every Pokemon 1st Generation (151).

The app will display pokemon and its stats, types, moves and more information on a dynamic individual component.

API:

The API used for this project will be the <https://pokeapi.co/>

Server-side:

The app will have a sign-up/login form with user authentication and database integration.

Logged users will be able to create specific pokemon teams containing a maximum of 6 pokemon each, which will then be saved into our database.

- Server will be created using Node.JS
- Database will be created using POSTGRESQL
- Authentication will run on Auth0 in React
